A “Weep” device or screed is code required at the foundation plate line for cement plaster over framed walls. This weep screed trim accessory allows incidental moisture to weep out and protects against ground water wicking up to the cement plaster (stucco).

- Screed shall have a 3 ½ inch nailing flange
- Holes are optional, solid flange will also weep.
- J or casing bead style weep screed is approved, holes required
- V style (pictured) may be over lapped, J or casing style must be abutted

The SMA cannot provide a warranty, written or implied. Every situation is unique and approval is by the designer of record and local building official.
